

ABSTRACT OF THE DISCLOSURE

A prophylactic device includes a panty having a crotch portion and an elongated pouch disposed on the crotch portion. The pouch is made of an elastic material, and the panty and the pouch are integrally formed. The pouch can include longitudinal pleats, and an interior of the panty can include a plurality of raised protrusions positioned to facilitate positioning of the panty on a user. The rear portion of the panty can include a sculpted portion that is configured to curve inward to conform to the shape of a user's lower back when the panty is in an in-use configuration. The prophylactic device can be produced by a dipping process that results in a device with a thicker pouch than panty.
